

Appendix B - Mac OS X installation

Cross-PC 5 can also be run on AppleTM operating systems starting from Mac OS X 10.6 and later, just use one of the two existing Wine interpretations for this environment: the free WineBottler program (<http://winebottler.kronenberg.org/>), or its paid counterpart CrossOver Mac (<https://www.codeweavers.com/products/crossover-mac/>).

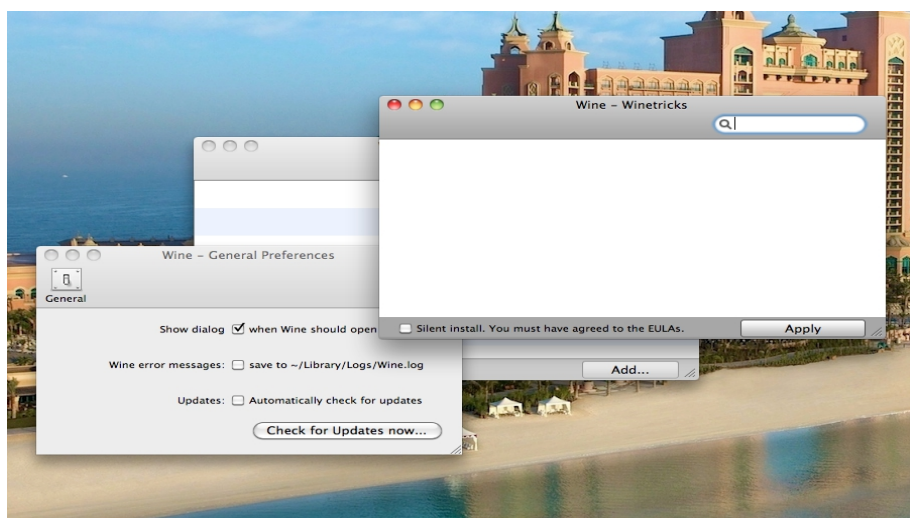

Apart from their initial installation and configuration, slightly different, the behavior of the two applications from the point of view of Windows programs is practically superimposable, so that we will show only how to install Cross-PC 5 on WineBottler. Once you have downloaded the WineBottler.dmg file from the official website and dragged it to your desktop (it is optional, it can also remain in the Download folder), double click on it to open the disk image that will contain the following programs:

Drag in the Applications folder (you can do it in this window) only the Wine icon (WineBottler is used to create stand-alone packages of Windows programs via Wine, it is not necessary to install it). Once dragged, go to the Applications folder of your Mac to run Wine. Initially a glass icon will appear in the menu bar at the top right (near the clock),

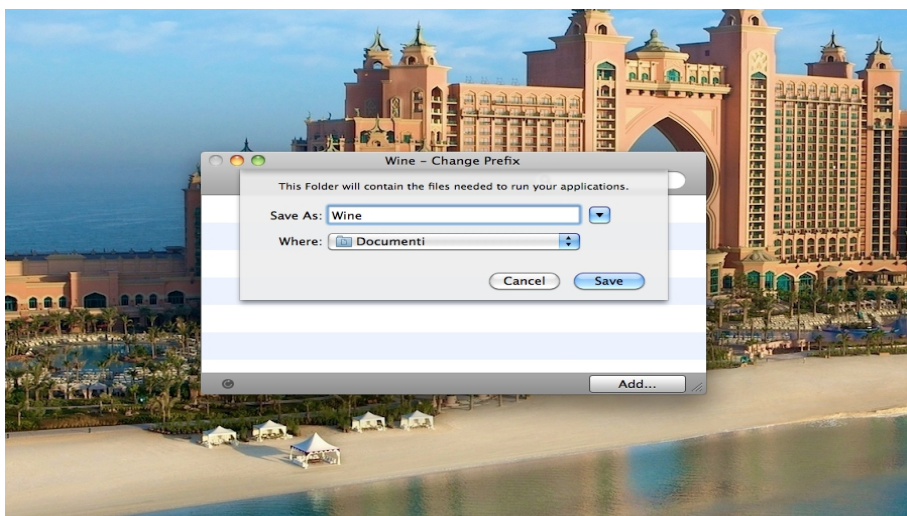

followed by three configuration windows on the desk:

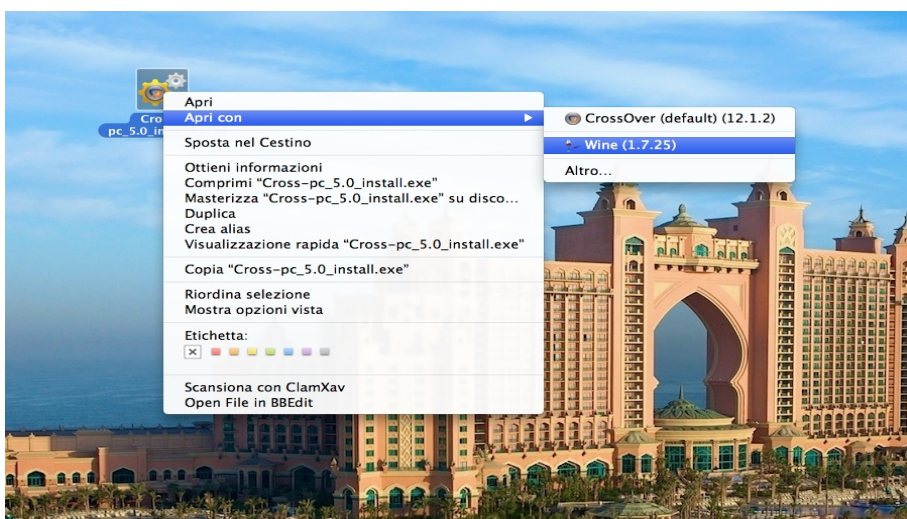

Following the order in which you see the windows in the figure, you have to: press the "Apply" button on "Wine - Winetricks", close the "Wine - General Preferences" window with the red button and finally give a name to the folder where it will reside all the emulated system with the programs eventually installed (Wine - Change Prefix).

At this point, you will find the Wine emulator correctly installed and configured on your Apple computer.

Let's download, if we have not done it, Cross-PC 5 from the Audioplay website, unzip the ZIP archive and place it on the desktop. We click with the right mouse button (or ctrl + click for the old mouse with a single button) and, from the context menu, select "Open with Wine".

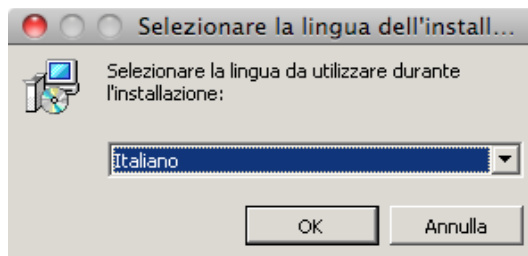

Wine will ask you, through a dialogue window, the action to be taken:

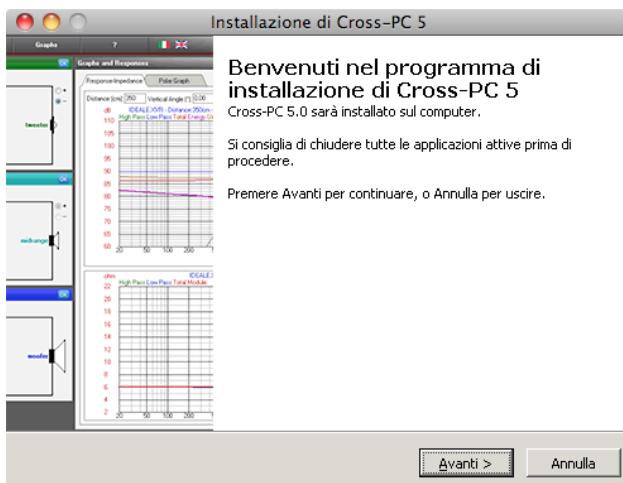

Confirm the entry "*Run directly in ...*" (if WineBottler is not installed, only that will be selectable), put the check mark on "*Don't show this dialog again*" (so the next time you will not ask again ...) and press the "Go" button.

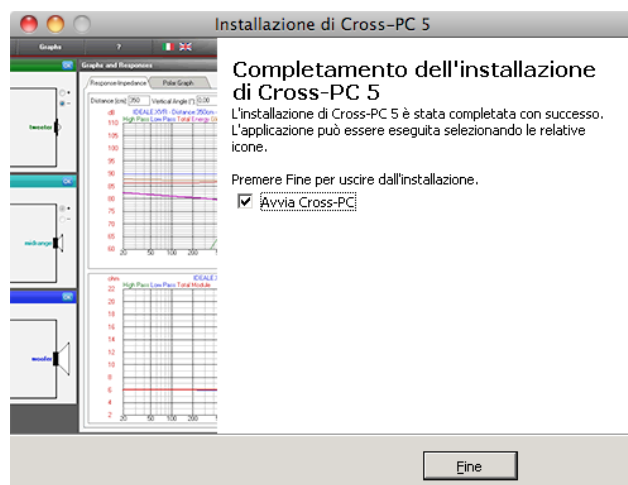

After a few moments, the first screen of the Cross-PC 5 installation will appear:

Continue in the same way as described for Windows:

Always with the "Next" button, we will arrive at the end of the installation:

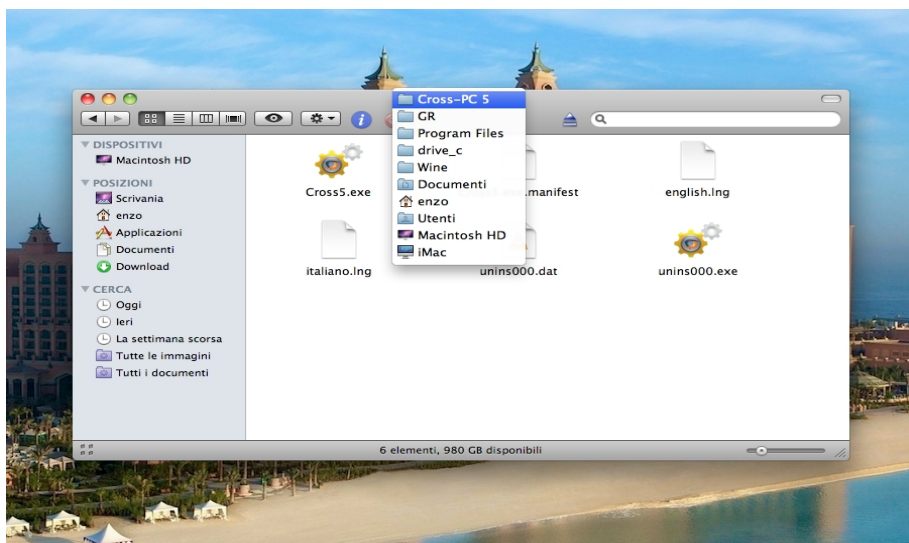

Unfortunately, this version of Wine does not create any connection on the desktop (CrossOver Mac instead yes), so you have to look for the executable just installed manually.

It is not difficult, however: in one of the previous steps we had communicated to Wine the position of the whole system emulated, in our case it is located in the Documents folder.

Browsing within the subfolders contained in the Documents/Wine, we quickly find the position of Cross-PC 5 (complete path:

Documents/Wine/drive_c/Program Files/GR/Cross-PC 5, see figure).

We just have to double click on the application icon (or right click, then "Open with Wine", if there is also CrossOver installed) and take advantage of the full power of Cross-PC 5 on Mac!
